Student Submission: Assignment 1 - Distributed Storage System

Student: Alex Chen (STU-2026-081) | Course: CS301

Executive Summary: Implemented a ring topology with 128 virtual nodes per physical worker.
Consistency Model: Tunable quorum with W=2, R=2, N=3 ensuring read-your-writes consistency.
Benchmark Results: Average write latency 4.2ms, Read throughput 12,500 requests/second under test harness.
Self-Reflection: Handling dynamic node churn required adding an epoch-based vector clock protocol.
Attached code files: server.js, ring.js, quorum.js, tests.js.
